15 Estimates of Changes in Labour Force Status and Gross Flows Derived from Matched Records, Queensland, October 1986 to November 1986	22
Technical Notes	23,24

Main Features

- In November 1986, the labour force in Queensland was estimated to be 1,224,100 and comprised 735,400 males and 488,700 females, including 288,800 married females.
- Employed persons in November 1986 totalled 1,116,500. Males numbered 674,200 and females 442,400. Of the females, 269,400 were married.
- The estimated number of persons unemployed in Queensland in November 1986 was 107,600 or 8.8 per cent of the labour force. Of this total, the number of persons looking for part-time work was estimated to be 19,300.
- Of the total unemployed, 23,900 persons, or 22.2 per cent, were in the 15 to 19 years age group.

Main Features (continued)

This represents an unemployment rate of 16.7 per cent for this age group.

- The unemployment rate of 8.8 per cent recorded in November 1986 showed a decrease from the rate of 9.1 per cent recorded in October 1986, continuing the trend shown in the previous 2 months. The November 1986 figure is an increase from the rate of 8.1 per cent recorded in November 1985.

• Between October and November 1986 gross flows into or out of full-time employment were not statistically significant. However, the movement into part-time employment was greater than the movement out while the outward movement from unemployment exceeded the inward movement. There was a net decrease in the "persons not in the labour force" category.

Explanatory Notes

Introduction

This publication contains estimates of the civilian labour force derived from the labour force survey part of the monthly population survey.

2. Although emphasis in the population survey is placed on the regular collection of specific data on demographic and labour force characteristics of the population, supplementary and special surveys of particular aspects of the labour force or of other subjects are carried out from time to time. Statistics from these surveys are published and are available on request.

The Population Survey

3. The survey is based on a multi-stage area sample of private dwellings and non-private dwellings (hotels, motels, etc.) and usually covers slightly more than two-thirds of 1 per cent of the population of Queensland. The information is obtained from the occupants of selected dwellings by carefully chosen and specially trained interviewers. The interviews are generally conducted during a period of 2 weeks beginning on the Monday between the 6th and 12th of each month. The information obtained relates to the week before the interview (i.e. the survey week).

Scope

4. The labour force survey includes all persons aged 15 years and over except:

- (a) members of the permanent defence forces;
- (b) certain diplomatic personnel of overseas governments, customarily excluded from Census and estimated populations;
- (c) overseas visitors holidaying in Australia; and
- (d) members of non-Australian defence forces (and their dependants) stationed in Australia.

Definitions

5. The labour force category to which a person is assigned depends on the actual activity (i.e. whether working, looking for work, etc.) during the survey week. The following definitions, which conform closely to the

international standard definitions specified by the International Labour Office (ILO), relate only to those persons within the scope of the survey.

6. Employed persons comprise all those aged 15 years and over who, during the survey week:

- (a) worked for 1 hour or more for pay, profit, commission, or payment in kind in a job or business, or on a farm (including employees, employers, and self-employed persons); or
- (b) worked for 1 hour or more without pay in a family business or on a farm (i.e. unpaid family helpers); or
- (c) were employees who had a job but were not at work and were: on paid leave; on leave without pay for less than 4 weeks up to the end of the survey week; stood down without pay because of bad weather or plant breakdown at their place of employment for less than 4 weeks up to the end of the survey week; on strike or locked out; on workers' compensation and expected to be returning to their job; or receiving wages or salary while undertaking full-time study; or
- (d) were employers, self-employed persons, or unpaid family helpers who had a job, business, or farm, but were not at work.

7. Full-time workers are those who usually work 35 hours or more a week and others who, although usually part-time workers, worked 35 hours or more during the survey week.

8. Part-time workers are those who usually work less than 35 hours a week and who did so during the survey week.

9. Hours of work. The figures of average hours refer to actual hours worked during the survey week, not hours paid for. They may be affected by public holidays, leave, or absenteeism; temporary absence from work due to sickness, injury, accident, and industrial disputes; and stoppages of work due to bad weather, plant breakdown, etc. When hours of work are recorded, fractions of an hour are disregarded and this results in slightly lower figures than would be the case if actual time worked was

Explanatory Notes (continued)

Definitions (continued)

Hours of work (continued)

recorded. Persons stood down for the whole of the survey week without pay because of bad weather or plant breakdown at their place of employment are regarded as employed and therefore are included (working no hours) in the calculation of average hours worked. Persons stood down in the survey week for reasons other than bad weather or plant breakdown and waiting to be called back to their job are regarded as unemployed and are therefore excluded from the calculations.

10. Unemployed persons are those aged 15 years and over who were not employed during the survey week, and:

- (a) had actively looked for full-time or part-time work at any time in the 4 weeks up to the end of the survey week and:
 - (i) were available for work in the survey week, or would have been available except for temporary illness (i.e. lasting for less than 4 weeks to the end of the survey week); or
 - (ii) were waiting to start a new job within 4 weeks from the end of the survey week and would have started in the survey week if the job had been available then; or
- (b) were waiting to be called back to a full-time or part-time job from which they had been stood down without pay for less than 4 weeks up to the end of the survey week (including the whole of the survey week) for reasons other than bad weather or plant breakdown.

11. Actively looking for work includes writing, telephoning, or applying in person to an employer for work; answering a newspaper advertisement for a job; checking factory or Commonwealth Employment Service notice-boards; being registered with the Commonwealth Employment Service; checking or registering with any other employment agency; advertising or tendering for work; and contacting friends or relatives.

12. Unemployed persons looking for first job are those who had never worked full-time for 2 weeks or more.

13. The unemployment rate for any group is the number unemployed expressed as a percentage of the labour force (i.e. employed plus unemployed) in the same group.

14. Duration of unemployment is the period from the time the person began looking for work or was laid off to the end of the survey week. Thus the survey measures current (and continuing) periods of unemployment rather than completed spells. For persons who may have begun looking for work while still employed, the duration of unemployment is defined as the period from the time the person last worked full-time for 2 weeks or more to the end of the survey week. Periods of unemployment are recorded in

complete weeks and this results in a slight understatement of duration.

15. Median duration of unemployment is the duration which divides unemployed persons into two equal groups, one comprising persons whose duration of unemployment is above the median and the other comprising persons whose duration is below it.

16. Unemployed persons classified by industry and occupation. Unemployed persons who had worked full-time for 2 weeks or more in the last 2 years are classified according to the industry and occupation of their most recent full-time job.

17. The labour force comprises all persons who, during the survey week, were employed or unemployed, as defined above.

18. The labour force participation rate for any group is the labour force expressed as a percentage of the civilian population aged 15 years and over in the same group.

19. Persons not in the labour force are those who, during the survey week, were not in the categories employed or unemployed as defined. This category therefore includes persons who were keeping house (unpaid), attending an educational institution (e.g. school or university), retired or voluntarily inactive, permanently unable to work, inmates of institutions, trainee teachers, members of contemplative religious orders, and persons whose only activity during the survey week was jury service or unpaid voluntary work for a charitable organisation.

20. Specific surveys of persons not in the labour force indicate that a number of persons want to work but are not classified as unemployed because they were not looking for work or were not available to begin work in the survey week. Included in this group are the discouraged jobseekers and other persons marginally attached to the labour force.

21. Marital status. In the labour force survey, persons are classified as married or not married. Marital status is determined from information supplied by the respondent about the individual himself or herself and, where the person was reported as being married, about the living arrangements of persons usually resident in the household. Marital status does not therefore necessarily reflect legal status. Persons are classified as married if they are reported as being married (including de facto) and their spouse was a usual resident of the household at the time of the survey. The not married category includes persons who have never married, or are widowed, separated, or divorced, as well as those who, although reported as being married, did not have a spouse who usually lived in the household. Persons who live in a de facto relationship but do not volunteer this information when asked whether they are married, are classified as not married.

Explanatory Notes (continued)Definitions (continued)

22. Industry classification. Industry is classified according to the Australian Standard Industrial Classification (ASIC), 1983.

23. Occupation classification. Occupation is classified according to the Australian Standard Classification of Occupations (ASCO), 1986, which replaced the Classification and Classified List of Occupations (CCLO), Revised November 1980, used in the surveys prior to August 1986.

24. The new classification relies on the level and specialisation of skill required to perform primary tasks satisfactorily as its classificatory variable and is therefore significantly different from the previous classification. Detailed information on the ASCO classification and structure is contained in the publication "ASCO Statistical Classification" (Catalogue No. 1222.0).

25. Gross flows. In order to minimise respondent burden and at the same time maintain continuity within the population survey sample, one-eighth of the dwellings in the sample (except the large non-private dwellings) are replaced after each survey. Adoption of this rotation procedure enables more reliable measurements of changes in the labour force characteristics of the population to be made than would be possible if a new sample were introduced each month.

26. Because a high proportion of private dwellings selected in one survey remains in the sample for the following survey, it is possible to match the characteristics of most of the persons in those dwellings from one month to the next, to record any changes that occur, and hence to produce estimates of flows between the different categories of the population and labour force.

27. The procedures used to select persons in non-private dwellings preclude the possibility of matching any of them who may be included in successive surveys. For this and other reasons, including the mobility of the population and non-response in either or both surveys, about 10 per cent of persons in those dwellings which are included in the sample in successive months cannot be matched. Those who can be matched represent about 80 per cent of all persons in the survey.

28. Changes in the characteristics of this latter group are shown in the gross flows table. About half of the remaining (unmatched) 20 per cent of persons in the survey are likely to have characteristics similar to those in the matched group, but the characteristics of the other half are likely to be somewhat different.

29. Gross flow estimates relate only to those persons in private dwellings for whom information was obtained in successive surveys. The expansion factors used in calculating the estimates were those applying to the second of each pair of months.

30. Although it is not possible to provide gross flow estimates for all persons in the survey, it is considered

that the estimates derived from matched records will be a useful guide to the magnitude of the movements between categories which underlie the changes in monthly levels. When comparing flows for different periods it is important to take into account the population represented by the matched sample, as shown in the last line of the table.

31. While every effort is made to reduce non-sampling errors to a minimum, any such errors affecting labour force status will tend to accumulate in the gross flow statistics rather than to cancel out. The estimates are also subject to sampling variability, as explained in the Technical Notes. For these reasons the estimates of flows should be used with caution. The standard errors may be obtained from Table A of the Technical Notes.

32. Estimates of total flows into or out of the employed category may be less than the sum of the estimates for employed full-time and employed part-time as the estimates for the latter two categories include movements between these two categories.

33. Family status. As a part of survey procedures, family relationships are determined each month, enabling both the estimation of persons cross-classified by their family status and the estimation of families.

34. Because of the coverage rules of the population survey which associate persons with particular dwellings so that each person has an equal chance of selection in the survey, persons who usually live with other members of their family may, at the time of the survey, be enumerated as not living with all the usual members of their family. This situation is more likely for persons who are enumerated as visitors to other private dwellings or as persons staying in non-private dwellings (hotels, caravan parks, hospitals, etc.). The determination of family structure and family characteristics in such cases is most difficult. Thus, family information was not obtained for the following persons:

- (a) all persons enumerated in non-private dwellings (including hotels, motels, and hospitals and other institutions); and
- (b) persons enumerated as visitors to (rather than usual residents of) private dwellings.

35. In addition, in those private dwellings where it was not possible to obtain information relating to all the usual residents, no family information was recorded. Thus the family characteristics of persons living in families which include a member of the permanent defence forces, who is outside the scope of the population survey, are not determined because family information could not be obtained from each usual resident. Similarly families which at the time of the survey have one or more of their members away from the usual residence, are also excluded from family determination. A summary of those persons for whom family information was obtained, as well as those usual residents of private dwellings for whom complete family information could not

Explanatory Notes (continued)

Family Status (continued)

be obtained, and those persons specifically excluded from the family determination procedures is contained in the family tables. Generally, family status is determined for more than 90 per cent of all civilians aged 15 years and over.

Population Benchmarks

36. Labour force survey estimates of persons employed, unemployed, and not in the labour force are calculated in such a way as to add up to the independently estimated distribution of the population aged 15 years and over by age and sex. This procedure compensates for under-enumeration in the survey, and leads to more reliable estimates. The independent population statistics (benchmarks) are the latest available estimates at the time the labour force survey is conducted, but they usually differ from the official population estimates subsequently published in the ABS publication "Australian Demographic Statistics Quarterly" (Catalogue No. 3101.0) because they are necessarily derived from incomplete information about population changes.

Revision of Series

37. Survey estimates are not revised for the usually small amendments of population benchmarks arising from new data on deaths and overseas and internal migration. Revisions are made, however, after each Census of Population and Housing and when population estimation bases are reviewed. The population benchmarks used in labour force survey estimates are compiled according to place of usual residence.

39. Current publications produced by the ABS are listed in the "Catalogue of Publications" (Catalogue No. 1101.0) and those produced by the Queensland Office are listed in "List of Publications" (Catalogue No. 1101.3). A "Publications Advice" (Catalogue No. 1105.0) is issued on Tuesdays and Fridays which lists publications to be released in the next few days. These publications are available from any ABS Office.

Unpublished Statistics

40. The ABS can also make available certain labour force statistics which are not published. Where it is not practicable to provide the required statistics by telephone, they may be available in other forms, such as microfiche, photocopy, computer printout, or clerically extracted tabulation. A charge may be made for providing unpublished statistics in these forms.

41. For further information on these unpublished statistics contact Bevin Morris by telephoning Brisbane (07) 222 6029, or write to Information Services at the address above.

(a) Civilians who were residents of private dwellings where family status was determined.

(b) The number of unemployed in each group as a percentage of the labour force in the same group.

(c) The labour force in each group as a percentage of the civilian population aged 15 years and over in the same group.

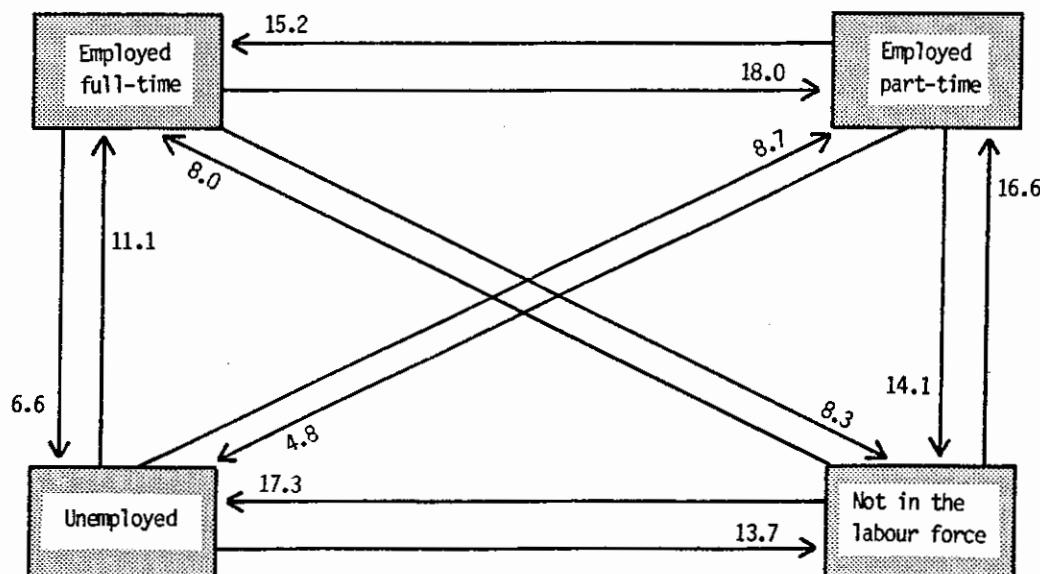

(d) Aged 15 years and over.

Table 15 - Estimates of Changes in Labour Force Status and Gross Flows (a) Derived from Matched Records, Queensland, October 1986 to November 1986
('000)

Particulars	Males	Females		Persons	
		Married	Total		
Labour force status					
October 1986		November 1986			
Employed full-time		Employed full-time	473.1	668.1	
		Employed part-time	5.5	18.0	
		Unemployed	4.7	6.6	
		Not in labour force	4.3	8.3	
Employed part-time		Employed full-time	5.3	15.2	
		Employed part-time	25.2	136.0	
		Unemployed	*	4.8	
		Not in labour force	4.7	14.1	
Unemployed		Employed full-time	7.7	11.1	
		Employed part-time	3.6	8.7	
		Unemployed	28.9	46.0	
		Not in labour force	5.9	13.7	
Not in labour force		Employed full-time	4.6	8.0	
		Employed part-time	4.6	16.6	
		Unemployed	5.2	17.3	
		Not in labour force	158.4	515.7	
Gross flows into		Employed	20.5	44.3	
		Full-time	17.6	34.3	
		Part-time	13.7	43.3	
		Unemployed	12.9	28.7	
		Not in labour force	14.9	36.0	
Gross flows out of		Employed	16.6	33.8	
		Full-time	14.6	32.9	
		Part-time	12.9	34.1	
		Unemployed	17.2	33.4	
		Not in labour force	14.5	41.9	
Total change of status	48.2	38.5	60.9	109.1	
Population represented by the matched sample	744.6	480.1	763.6	1,508.1

Diagram 4 - Estimates of Changes in Labour Force Status Derived from Matched Records, Queensland, October 1986 to November 1986
('000 persons)

Technical NotesEstimation Procedure

The labour force estimates are derived from the monthly population survey by use of a complex ratio estimation procedure, which ensures that the survey estimates conform to an independently estimated distribution of the population by age and sex, rather than to the age and sex distribution within the sample itself.

Reliability of the Estimates

Two types of error are possible in an estimate based on a sample survey: sampling error and non-sampling error. The sampling error is a measure of the variability that occurs by chance because a sample, rather than the entire population, is surveyed. Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings, the estimates and the movements derived from them are subject to sampling variability; that is, they may differ from the figures that would have been obtained if all dwellings had been included in the survey. One measure of the likely difference is given by the standard error which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included and about 19 chances in 20 that the difference will be less than two standard errors. The standard error can also be expressed as a percentage of the estimate, and this is known as the relative standard error.

Space does not allow for the separate indication of the standard errors of all estimates in this publication. Standard errors of estimates derived from the survey and of monthly, quarterly, and annual movements can be determined by using Tables A and B.

The size of the standard error increases with the level of the estimate, so that the larger the estimate the larger the standard error. However, it should be noted that the larger the sample estimate the smaller will be the standard error in percentage terms. Thus, larger sample estimates will be relatively more reliable than smaller estimates.

Standard errors of estimates derived from the monthly labour force survey have been re-estimated. The re-estimation follows the reselection of the sample in October 1982 and consequent production of data on a place of usual residence basis. The new standard errors were introduced for the February 1985 survey and are shown in Tables A, B, and C. The differences between the old and new standard errors are minor, with large estimates being associated with higher standard errors and smaller estimates having slightly lower standard errors.

As the standard errors in Table A show, the smaller the estimate the higher is the relative standard error.

Very small estimates are subject to such high standard errors (relative to the size of the estimate) as to detract seriously from their value for most reasonable use. For the labour force survey, estimates which have a relative standard error larger than 25 per cent are not published. In the tables in this publication, estimates below 3,000 and percentages based on such estimates have not been included but are indicated by *. Although figures for these small components can in some cases be derived by subtraction, they should not be regarded as reliable.

The movement in the level of an estimate is also subject to sampling variability. The standard error of the movement depends on the levels of the estimates from which the movement is obtained rather than the size of the movement. Standard errors of monthly movements are given in Table B. The estimates of standard error of monthly movements apply only to estimates of movements between two consecutive months. Movements between corresponding months of consecutive quarters (quarterly movements), corresponding months of consecutive years (annual movements) and other non-consecutive months, will generally be subject to somewhat greater sampling variability than is indicated in Table B. Standard errors of quarterly movements can be obtained by multiplying the figures in Table B by 1.5. Standard errors of all annual movements can be obtained by multiplying the figures in Table A by 1.3. When using Table A or Table B to calculate standard errors of movements, refer to the larger of the two estimates from which the movement is derived.

Examples of the calculation and use of standard errors are given below:

(a) From Table A it will be seen that an estimate of 20,000 has a standard error of 1,650. Therefore there are about two chances in three that the number that would have been obtained if all dwellings had been included in the survey would have been within the range 18,350 to 21,650 and about 19 chances in 20 that it would have been within the range 16,700 to 23,300.

(b) The estimate increases between two consecutive months by 25,000 to 75,000. Table B relates the standard error of the monthly movement to the larger of the two estimates from which the movement is derived. In this case the estimate of 75,000 is the larger. From Table B it will be seen that the standard error of the monthly movement is about 2,200. Therefore there are about two chances in three that if all dwellings had been included in the survey the movement would have been in the range +22,800 to +27,200 and about 19 chances in 20 that it would have been within the range +20,600 to +29,400.

Technical Notes (continued)Table A - Standard Errors of Estimates

Size of estimate	Standard error	Per cent of estimate
	No.	%
persons		
(a) 3,000	690	23.2
3,500	750	21.4
4,000	800	19.9
4,500	840	18.7
5,000	880	17.7
6,000	960	16.0
10,000	1,200	12.1
20,000	1,650	8.1
50,000	2,350	4.7
100,000	3,050	3.1
200,000	3,950	2.0
300,000	4,500	1.5
500,000	5,300	1.1
1,000,000	6,600	0.7

(a) Estimates below 3,000 have not been published (see text above).

Table B - Standard Errors of Estimates of Monthly Movements

Size of larger estimate	Standard error of estimate of monthly movements	Size of larger estimate	Standard error of estimate of monthly movements
3,000	680	20,000	1,350
3,500	720	50,000	1,900
4,000	760	100,000	2,400
4,500	790	200,000	3,150
5,000	820	300,000	3,650
6,000	880	500,000	4,400
10,000	1,050	1,000,000	5,600

The relative standard errors of estimates of average hours worked and median duration of unemployment are obtained by first finding the relative standard error of the estimate of the total number of persons contributing to the estimate (see Table A) and then multiplying the figure so obtained by the factors 0.7 for average hours worked and 2.0 for median duration of unemployment.

Publication cut-off points for these and other estimates are shown in Table C. Because of higher

relative standard errors, estimates of median duration of unemployment have higher cut-off points for publication than other estimates as shown in Table A.

Table C - Publication Cut-off Points for Labour Force Estimates

Estimates classified by	Number of persons
Average hours worked	.. 1,500
Median duration of unemployment	10,800
All other estimates	.. 3,000

The standard errors of estimates relating to agricultural employment are generally somewhat higher than the standard errors of other estimates of the same magnitude.

Proportions and percentages (for example, participation rates) formed from the ratio of two estimates are also subject to sampling error. The size of the error depends on the accuracy of both the numerator and denominator. The formula for the relative standard error (RSE) of a proportion or percentage is given below.

$$\text{RSE} \left(\frac{x}{y} \right) = \sqrt{\left[\text{RSE} (x) \right]^2 + \left[\text{RSE} (y) \right]^2}$$

Standard errors contained in Tables A and B are designed to provide an average standard error applicable for all monthly labour force survey estimates. Recent analysis of standard errors applicable to particular survey estimates has shown that the standard errors on estimates of employment are generally equivalent to those shown in Tables A and B, while standard errors for unemployment and persons not in the labour force are approximately 3 per cent lower and 6 per cent higher, respectively, than those shown in the tables.

The imprecision due to sampling variability, which is measured by the standard error, should not be confused with inaccuracies that may occur because of imperfections in reporting by respondents, errors made in collection such as in the recording and coding of data, and errors made in the processing of data. Inaccuracies of this kind are referred to as the non-sampling error, and they may occur in any enumeration, whether it be a full count or a sample. Every effort is made to reduce the non-sampling error to a minimum by careful design of questionnaires, intensive training and supervision of interviewers, and efficient operating procedures.
